

PROJECT : E-COMMERCE SALES

Executive Summary

Eleni Papadopoulos
Junior Data Analyst

1. This project analyzes an e-commerce dataset (not real).

We used Microsoft Excel :

- Pivot Tables
- Power Pivot
- DAX
- Pivot Charts

2. The objective was to answer the following questions and create a dashboard .

- How many products do we have in each category ?
- Who are our highest-value customers based on total revenue?
- Which customers place the highest number of orders?
- Which product categories generate the highest revenue?
- How has revenue changed over time?

3. Key findings :

- Electronics contains 3 products (60% of the portfolio) , while Furniture contains 2 products (40%).
- Based on the bar chart of top customers by revenue “John Smith” lead the race with total revenue 1405\$ following by Alice Green, Mariw Brown and Nick Black.
- John Smith placed the highest number of orders (2), while all remaining customers placed only one order each. This means that John is currently the most frequent customer.
- Electronics generated \$1,370 in revenue (72% of total sales), while Furniture generated \$530 (28%).
- According to the linegraph Monthly Revenue Trend Total revenue declined from \$1310 on Janary ro \$60 on Mrach (-95.42%). This downward trend may indicate seasonality or reduced customer demand and skould be investigated further.
- Laptop is the top-performing product,with \$1,200 (representing 63% of total revenue). The remaining products contribute significantly less,indicating that revenue is highly concentrated in a single product.
